MASTERING THE AFFLICTION WARLOCK PVP ROTATION IN CATACLYSM

The Affliction Warlock has long been a titan of attrition in World of Warcraft PvP, and the Cataclysm expansion refined this specialization into one of the most punishing and psychologically demanding specs in the arena. Unlike the burst-heavy Destruction or the pet-focused Demonology, Affliction excels at relentless pressure, spread damage, and oppressive crowd control. To truly dominate battlegrounds and rated arenas, you must understand not just which buttons to press, but the philosophy behind every global cooldown. This guide provides a deep dive into the Affliction Warlock PvP rotation in Cataclysm, covering openers, maintenance, burst windows, and survival techniques that separate the warlocks from the victims.

Understanding the Core Philosophy of

Affliction in Cataclysm PvP

Before we dissect the rotation itself, it is critical to grasp what makes Affliction unique in the Cataclysm PvP landscape. Your primary damage is not a single massive hit but a web of damage-over-time (DoT) effects that drain your opponent's health and resources. The **Affliction Warlock PvP rotation in Cataclysm** revolves around three pillars: maximum DoT uptime, efficient shard management, and precise burst alignment. Your goal is to force healers into overhealing and dispelling, create kill windows with Haunt and Soul Swap, and maintain constant pressure across multiple targets. This is not a spec for players who prefer simple priority lists; it rewards anticipation, awareness, and a willingness to spread misery.

Core Abilities and Talents That Define Your Rotation

Every successful PvP rotation begins with understanding your toolkit. While talents and glyphs can be adjusted for composition, certain abilities form the

backbone of any effective Affliction warlock in Cataclysm. These are the tools you will use constantly, and mastering their interplay is essential.

- **Corruption:** Your baseline damage-over-time spell, instant-cast and cheap. This is your most frequently applied DoT and benefits from Pandemic mechanics (refreshing early to extend duration).
- **Unstable Affliction:** A heavy-hitting, dispel-protected DoT. If an enemy dispels it, they take significant damage and are silenced. This is a powerful deterrent against healers.
- **Agony:** Your stackable, ramp-up DoT that deals increasing damage the longer it remains on a target. Maintaining high stacks is crucial for pressure.
- **Haunt:** A direct-damage spell that also increases all your DoT damage on the target by 20%. This is your primary finisher and burst enabler.
- **Drain Soul:** Your execute and Soul Shard generator. When a target is below 20% health, Drain Soul deals greatly increased damage and generates shards, allowing you to chain Haunt casts.
- **Fel Flame:** A useful instant-cast spell for spreading Corruption to nearby targets when talented or when you need to maintain pressure while moving.
- **Soul Swap:** A powerful tool that copies your DoTs onto a new target or spreads them in an area. Used correctly, it dramatically increases your spread pressure.
- **Curse of the Elements:** Essential for increasing magical damage

taken by your target. Always keep this up if no other curse is required.

- **Curse of Exhaustion:** A critical kiting and peeling tool. Slowing a melee opponent is often more valuable than a minor damage increase.

The Initial Engagement: Building Pressure from the Opener

Your opener sets the tone for the entire engagement. In high-level Cataclysm PvP, opponents will try to close the gap and interrupt your casting before you establish pressure. Therefore, the ideal opening sequence prioritizes instant-cast spells and mobility. Begin with **Curse of Exhaustion** or **Curse of the Elements** on the kill target. Follow immediately with **Corruption**, then **Unstable Affliction**. Apply **Agony** next so it begins stacking. If you have time and are not under pressure, cast **Corruption** and **Unstable Affliction** on a secondary target to begin building spread pressure. Remember, Affliction's strength lies in making every opponent's healer work overtime.

During this initial phase, your pet (typically the Felhunter for its Devour Magic and Spell Lock) should be on the offensive, interrupting key casts. Do not waste global cooldowns on direct damage spells until your DoTs are fully established. Once all three primary DoTs are active on the kill target, you can begin weaving in **Shadow Bolt** or

Haunt when the time is right. However, in the first few seconds, your priority is DoT application on as many viable targets as possible. A common mistake is tunneling a single target and ignoring the pressure that spread damage creates.

The Maintenance Phase: Weaving Pressure and Crowd Control

Once the battle is underway, the Affliction Warlock PvP rotation shifts from application to maintenance. Your goal is to keep all DoTs active on your primary target and at least Corruption and Unstable Affliction on off-targets. This phase is where you demonstrate mastery of timing and awareness. Use **Pandemic** to your advantage: refresh DoTs when they have less than 30% of their remaining duration, not after they expire. This prevents downtime and allows you to clip global cooldowns efficiently.

During maintenance, you must also weave crowd control. **Fear** is your primary tool for separating healers from their partners. Use it on the healer when your DoTs are fully applied, creating a window where the kill target receives no healing. **Mortal Coil** functions as both crowd control and a self-heal, making it invaluable when being pressured. **Howl of Terror** is excellent against melee clusters but must be used carefully to avoid breaking fears. The key is to never let your DoTs fall off while you focus on control. If you must move, use **Fel**

Flame to refresh Corruption and maintain pressure on the run.

Resource management also defines this phase. **Drain Soul** on sub-20% targets generates Soul Shards, which fuel **Haunt**. If you find yourself starved of shards, consider using **Drain Life** as a filler to preserve health, but only if you are not at risk of interrupts. A warlock without shards is a warlock without burst potential, so always be aware of your shard count.

Burst Window: Executing the Kill with Haunt and Cooldowns

Affliction may be a pressure spec, but it absolutely has burst windows that can delete an opponent. When your kill target is below 35% health, or when you have a trinket and offensive cooldowns ready, it is time to execute. The burst sequence is straightforward but demands precise timing. Begin by ensuring all three DoTs are fresh and full duration. If you have the **Haunt** glyph, its damage increase becomes even more potent. Cast **Haunt** to consume a shard and amplify your DoTs by 20%. Follow this immediately with **Drain Soul** if the target is below 20%, as it deals massive execute damage and generates a shard that may allow another Haunt.

However, the true burst window often involves **Soul Swap**. If you have DoTs on multiple targets, you can use Soul Swap to copy a full stack of Agony and your other DoTs onto the kill target instantly, saving global cooldowns and

catching the enemy healer off guard. Combine this with **Dark Soul** (your major damage cooldown) to dramatically escalate pressure. Once Dark Soul is active, every tick of corruption, every drain soul channel, and every haunt cast hits significantly harder. The combination of Dark Soul, Haunt, and Drain Soul can reduce a target from 100% to zero in seconds if they are not prepared.

Do not underestimate the value of **Fel Flame** during burst windows as well. While it may seem modest, an instant-cast spell that refreshes your Fire and Brimstone debuff or simply adds a little extra damage can make the difference when the kill target is trying to line of sight you.

Defensive Rotation: Staying Alive Under Pressure

A dead warlock deals no damage. The Affliction Warlock's defensive rotation in Cataclysm PvP is as important as the offensive one. When you are trained by melee classes like Warriors, Rogues, or Death Knights, your priority shifts to survival. Begin by applying **Curse of Exhaustion** to the attacker to slow their movement. Use **Fear** to create distance, but be wary of trinkets and cooldowns that break fear. **Mortal Coil** is an excellent panic button that simultaneously fears and heals you.

Your **Teleport** (Demon Circle) is a vital repositioning tool. Place it in a strategic location before the fight begins, ideally

behind a pillar or in a position that forces enemies to waste time reaching you. When a melee class blows their gap closers, teleport away and immediately reapply Curse of Exhaustion. Your pet should be intercepting or dispelling key buffs from the enemies. Remember that **Unstable Affliction** on your attacker serves as a deterrent—any healer who dispels it takes heavy damage and is silenced, creating a small window of respite.

If you are taking heavy physical damage, consider using **Life Tap** to build a shield via Soul Link (if talented), then switch to a Voidwalker for extra tankiness. Against caster cleaves, your Felhunter's **Spell Lock** is your best friend. Intercept a polymorph, a pyroblast, or a shadow bolt. The Affliction warlock is surprisingly durable when using cooldowns correctly, but you must treat your health bar as a resource to be managed, not a number to be ignored.

Advanced Tips: Spread Pressure and Cooldown Trading

Once you are comfortable with the basic rotation, you must learn to think several steps ahead. In high-rated Cataclysm arena, games are won by forcing cooldowns and then punishing mistakes. An excellent Affliction Warlock spreads DoTs to all three members of the opposing team. This forces the enemy healer to choose between dispelling, healing, or letting damage accumulate. Every global cooldown a healer spends

on dispelling is a global cooldown not spent on incoming burst. Furthermore, spread pressure rapidly drains mana from healers, especially when they are forced to cast expensive heals on multiple targets.

Knowing when to commit to a kill is vital. If the enemy healer has used their trinket, or if they have been forced into a corner with a fear, that is your window. Do not waste your burst on a target who is immune or shielded. Use **Healthstones** and **Harvest Life** (if talented) to maintain your own health while continuing to pressure. A warlock at full health is a threat; a warlock at 10% health is a target. Do not overextend for a kill that is not there.

Common Mistakes and How to Avoid

Them

Even experienced warlocks can fall into predictable patterns. One of the most frequent errors is allowing Agony to fall off. Because it ramps in damage over time, losing stacks means you have to rebuild them, wasting precious damage windows. Another mistake is using **Haunt** without having full DoTs up. A Haunt without the benefit of maximum DoT damage is a wasted shard. Also, many warlocks neglect **Soul Swap** entirely or use it without understanding its copy-and-paste functionality. Soul Swap can refresh your DoTs on a moving target or instantly apply a full set of DoTs to a new enemy entering the fray.

Underestimating the value of **Drain Life** is another common pitfall. While Drain Soul is your execute, Drain Life provides sustained healing that can keep you competitive against rot damage. Do not
